bright future.

FREE CHILDREN'S VISION SCREENING

Why Vision Screening is Important

The goal of vision screening is to identify and treat preventable vision concerns at the earliest age possible.

Steps to a Bright Future for Your Child

If your young child is over 6 months, call the Delta Gamma Center for Children with Visual Impairments to set up an appointment with the Office Manager for a complete vision screening.

What is Vision Screening

Vision Screening is a simple, quick test that can identify many types of eye problems, and it helps to identify children with eye conditions that are likely to lead to visual impairment. This allows for early referral for further evaluation and treatment when it is most effective.

A hand held scanner is used to screen for vision disorders. It takes just seconds, is painless, and requires nothing of the child except his/her attention. Results are immediately available.
